

■ 1.3.6 Interrupting Calculations

There will probably be times when you want to stop *Mathematica* in the middle of a calculation. Perhaps you realize that you asked *Mathematica* to do the wrong thing. Or perhaps the calculation is just taking a long time, and you want to find out what is going on.

The way that you interrupt a *Mathematica* calculation depends on what front end you are using.

textual front ends	type <code>CONTROL-C</code>
graphical front ends	click on the stop button, or type <code>CONTROL-C</code> or <code>CONTROL-.</code>

Some typical ways to interrupt calculations in *Mathematica*.

On some computer systems, it may take *Mathematica* a perceptible time to respond to your interrupt. When *Mathematica* does respond, it will typically give you a menu of possible things to do. Exactly what is on this menu will depend on what computer system you are using.

<code>continue</code>	continue the calculation
<code>show</code>	show what <i>Mathematica</i> is doing
<code>abort</code>	abort this particular calculation
<code>exit</code>	exit <i>Mathematica</i> completely

Some typical options when you interrupt a calculation in *Mathematica*.
