

■ 1.9.5 POSTSCRIPT Page Description Language

As discussed in Section 1.8.5, *Mathematica* generates all its graphics in POSTSCRIPT form. You will usually not need to look at the POSTSCRIPT form: it will simply be rendered by your *Mathematica* front end.

However, if you want to send graphics from *Mathematica* to other output devices, or if you want to include the graphics in documents, you may need to get at the POSTSCRIPT form directly.

`Display["file", graphics]` write the POSTSCRIPT form of graphics into a file

POSTSCRIPT output.

For some purposes, you may need to edit the POSTSCRIPT that *Mathematica* produces. You will find that most of the POSTSCRIPT is quite simple. There are some complications, however, associated with text that is embedded in graphics: to allow for the different fonts available with different POSTSCRIPT renderers, *Mathematica* leaves the final calculations about positioning of text to the POSTSCRIPT interpreter.
