

■ 2.6.5 Generating Tabular Output

<code>TableForm[expr]</code>	print in tabular form
<code>MatrixForm[expr]</code>	print as a matrix

Functions for tabular output.

`TableForm` displays lists of expressions in columns.

```
In[1]:= TableForm[{10!, 15!, 20!}]
3628800
1307674368000
Out[1]//TableForm= 2432902008176640000
```

Here is a matrix, printed out as a list of lists in standard *Mathematica* output form.

```
In[2]:= m = Table[i^j, {i, 3}, {j, 3}]
Out[2]= {{1, 1, 1}, {2, 4, 8}, {3, 9, 27}}
```

`TableForm` displays the entries in the matrix in a two-dimensional array.

```
In[3]:= TableForm[m]
1      1      1
2      4      8
Out[3]//TableForm= 3      9      27
```

`MatrixForm` displays the entries in an array where every element is placed in an area of the same width and height.

```
In[4]:= MatrixForm[m]
1      1      1
2      4      8
Out[4]//MatrixForm= 3      9      27
```

You can use `TableForm` and `MatrixForm` to display lists that are nested more than two levels deep. Successive dimensions are laid out alternately in horizontal and vertical directions.
