

■ 2.7.6 Advanced Topic: Manipulating Whole Contexts

<code>?context`*</code>	give information on all objects in a context
<code>Names["context`*"]</code>	give a list of the names of all objects in a context
<code>NameQ["context`*"]</code>	give <code>True</code> if there are any objects in a context
<code>Remove["context`*"]</code>	remove all objects in a context

Functions for manipulating whole contexts.

Like other packages, `CombinatorialFunctions.m` defines objects in its own context.

```
In[1]:= <<CombinatorialFunctions.m
```

This gives a list of strings corresponding to all the objects defined in the package.

```
In[2]:= Names["CombinatorialFunctions`*"]
Out[2]= {CatalanNumber, Fibonacci, Hofstadter,
         Subfactorial}
```

This removes all the objects in the context, both clearing their values, and removing their names from the list of known objects.

```
In[3]:= Remove["CombinatorialFunctions`*"]
```
