

■ B.2.3 Input Control

Mathematica expressions can continue for several lines. Newlines (line feeds or returns) are equivalent to spaces.

With many front ends, *Mathematica* tests to see whether your input is finished every time you get to the end of a line. This means that you can open a bracket on one line, then type several lines of input. *Mathematica* will assume that you have not finished giving your input until you type a matching close bracket.

If the presence of unmatched brackets, or some other input structure, does not already indicate it, you can always show that your input continues for several lines by typing `\` at the end of the line.
