

■ B.3.3 Options

Some built-in functions can take *options*. Each option has a name, represented as a symbol. Options are set by giving rules of the form *name*->*value*. Such rules must appear after all the other arguments in a function. Rules for different options can be given in any order. If you do not explicitly give a rule for a particular option, a default setting for that option is used.

<code>Options[f]</code>	show the default rules for all options associated with <i>f</i>
<code>Options[expr]</code>	give the options set in a particular expression
<code>SetOptions[f, name->value, ...]</code>	set default rules for options associated with <i>f</i>

Operations on options.
