

■ Dump

`Dump["filename"]` writes a complete image of the current state of your *Mathematica* session to a file.

`Dump["filename", startup]` includes the command *startup*, to be run when the image is executed.

`Dump["filename", startup, "code"]` uses the executable binary in the file "*code*". The default for "*code*" is `$CommandLine[[1]]`.

`Dump` is only available on certain computer systems. ■ The files produced by `Dump` may be very large. ■ `Dump` closes any files that are open. (Files could have been changed when the image is restarted.) ■ See page 591. ■ See also: `Save`.
