

## ■ End

`End [ ]` returns the present context, and reverts to the previous one.

Every call to `End` must be balanced by an earlier call to `Begin`. ■ `End [ ]` resets the value of `$Context`. ■ `End [ ]` returns the present context name as a string of the form `"context`"`. ■ `End [ ]` does not modify `$ContextPath`. ■ See pages 310 and 313.
