

■ EvenQ

`EvenQ[expr]` gives `True` if *expr* is an even integer, and `False` otherwise.

`EvenQ[expr]` returns `False` unless *expr* is manifestly an even integer (i.e. has head `Integer`, and is even). ■ You can use `EvenQ[x] = True` to override the normal operation of `EvenQ`, and effectively define *x* to be an even integer. ■ See pages 230 and 326. ■ See also: `IntegerQ`, `OddQ`, `TrueQ`.
