

■ FactorList

`FactorList[poly]` gives a list of the factors of a polynomial, together with their exponents.

The first element of the list is always the overall numerical factor. It is $\{1, 1\}$ if there is no overall numerical factor.

■ Example: `FactorList[3 (1+x)^2 (1-x)]` $\longrightarrow$ $\{\{-3, 1\}, \{-1 + x, 1\}, \{1 + x, 2\}\}$.

■ `FactorList[poly, Modulus->p]` factors modulo a prime p . ■ See page 388. ■ See also: `CoefficientList`.
