

■ Flatten

`Flatten[list]` flattens out nested lists.

`Flatten[list, n]` flattens to level n .

Example: `Flatten[{a,{b,c},{d}}]  $\longrightarrow$  {a, b, c, d}`. ■ `Flatten` “unravels” lists, effectively just deleting inner braces. ■ `Flatten[list, n]` effectively flattens the top level in *list* n times. ■ `Flatten[f[e, ...]]` flattens out subexpressions with head f . ■ `Flatten[expr, n, h]` flattens only subexpressions with head h . ■ See page 104. ■ See also: `Partition`.
