

■ GCD

$\text{GCD}[expr_1, expr_2, \dots]$ gives the greatest common divisor of the expressions $expr_i$.

The $expr_i$ may be either integers or polynomials.

$\text{GCD}[expr_1, \dots, \text{Modulus} \rightarrow n]$ evaluates the GCD modulo the integer n .

Integer mathematical function (see Section ??). ■ $\text{GCD}[expr_1, \dots]$ gives the factors common to all the $expr_i$. ■ See pages 345 and 388. ■ See also: `Rational`, `LCM`, `ExtendedGCD`, `Cancel`.
