

■ Get

`<<filename` reads in a file, evaluating each expression in it, and returning the last one.

On systems with advanced graphical interfaces, there will usually be graphical tools for reading in files. ■ The `.m` extension in *Mathematica* file names must be included explicitly. ■ `Get` is for reading in files that contain *Mathematica* input only.

■ The list of directories `$Path` is searched for a file with the specified name. ■ `<<"filename"` is equivalent to `<<filename`. The `"` can be omitted if the filename contains only the following non-alphanumeric characters: `.`, `/` and `~`. ■ Syntax errors in files are reported in the standard form: `filename: line: syntax error in expr`. `Get` continues attempting to read a file even after a syntax error has been detected. ■ See page 286. ■ See also: `Read`, `StartProcess`, `RunThrough`, `Put`, `Splice`.
