

■ InputForm

`InputForm[expr]` prints as a version of *expr* suitable for input to *Mathematica*.

Example: `InputForm[x^2 + 1/a]` $\longrightarrow$ `a^(-1) + x^2`. ■ `InputForm` always produces one-dimensional output, suitable to be typed as lines of *Mathematica* input. ■ `Put (>>)` produces `InputForm` by default. ■ See page 268. ■ See also: `OutputForm`, `FullForm`
