

■ LegendreType

`LegendreType` is an option for `LegendreP` and `LegendreQ` which specifies choices of branch cuts for Legendre functions in the complex plane.

The possible settings for `LegendreType` are `Real` and `Complex`. ■ With `LegendreType->Complex`, there is a branch cut from $-\infty$ to $+1$. With `LegendreType->Real`, there are branch cuts from $-\infty$ to -1 and $+1$ to $+\infty$. ■ See page 371.
