

■ Line

`Line[{pt1, pt2, ...}]` is a graphics primitive which represents a line joining a sequence of points.

`Line` can be used in both `Graphics` and `Graphics3D` (two- and three-dimensional graphics). ■ The positions of points can be specified either in absolute coordinates, as $\{x, y\}$ or $\{x, y, z\}$, or in scaled coordinates as `Scaled[{x, y}]` or `Scaled[{x, y, z}]`. ■ The line consists of a sequence of straight segments joining the specified points. ■ In two and three dimensions, the line thickness can be specified using the graphics primitive `Thickness`. ■ Line shading or coloring can be specified using `GrayLevel` or `RGBColor`. ■ In two dimensions, dashed lines can be specified using `Dashing`. ■ In three dimensions, the properties of lines that appear at intersections between polygons can be specified using `EdgeForm`. ■ See pages 142 and 149. ■ See also: `Polygon`.
