

■ LinearSolve

`LinearSolve[m, b]` gives the vector x which solves the matrix equation $m.x=b$.

`LinearSolve` works on both numerical and symbolic matrices. ■ The matrix m can be square or rectangular.

■ `LinearSolve[m, ZeroTest -> test]` evaluates `test[m[[i, j]]]` to determine whether matrix elements are zero. The default setting is `ZeroTest -> (# == 0)&`. ■ See page 448. ■ See also: `Inverse`, `PseudoInverse`, `Solve`, `NullSpace`.
