

■ LineBreak

`LineBreak[n]` is output between the n^{th} and $(n+1)^{\text{th}}$ lines in a multiline printed expression.

Redefining `Format[LineBreak[n_]]` changes the way spaces are printed between lines. ■ Setting

`Format[LineBreak[_]] = ""` specifies that a zero-size object is to be used between lines, and causes successive lines to be printed with no intervening blank lines. ■ Additional blank lines can be inserted by setting `Format[LineBreak[_]]` to be an object that is several lines high. ■ See page 588. ■ See also: `Continuation`, `StringBreak`, `Indent`.
