

■ List

$\{e_1, e_2, \dots\}$ is a list of elements.

Lists are very general objects that represent collections of expressions. ■ Functions with attribute `Listable` are automatically “threaded” over lists, so that they act separately on each list element. Most built-in mathematical functions are `Listable`. ■ $\{a, b, c\}$ represents a vector. ■ $\{\{a, b\}, \{c, d\}\}$ represents a matrix. ■ Nested lists can be used to represent tensors. ■ See page 90.
