

■ Literal

`Literal[expr]` represents *expr* on the left-hand side of an assignment, maintaining *expr* in an unevaluated form.

`Literal` has attribute `HoldFirst`. ■ Certain parts of the left-hand sides of assignments are usually evaluated. You can use `Literal` to stop any part from being evaluated. ■ Example: `f[Literal[Integrate[y_, x_]]] := value` can be used to make an assignment for expressions of the form `f[Integrate[y_, x_]]`. Without `Literal`, the `Integrate` function would be evaluated at the time of assignment. ■ See pages 221 and 570. ■ See also: `Hold`.
