

■ Max

`Max`[$x_1, x_2, \dots$] yields the numerically largest of the x_i .

`Max`[[$x_1, x_2, \dots$], [$y_1, \dots$], ...] yields the largest element of any of the lists.

`Max` yields a definite result if all its arguments are real numbers. ■ In other cases, `Max` carries out some simplifications.

■ `Max`[] gives `-Infinity`. ■ See page 341. ■ See also: `Min`, `Order`.
