

■ Min

`Min`[$x_1, x_2, \dots$] yields the numerically smallest of the x_i .

`Min`[{ $x_1, x_2, \dots$ }, { $y_1, \dots$ }, ...] yields the smallest element of any of the lists.

`Min` yields a definite result if all its arguments are real numbers. ■ In other cases, `Min` carries out some simplifications.

■ `Min`[] gives `Infinity`. ■ See page 341. ■ See also: `Max`, `Order`.
