

■ AtomQ

`AtomQ[expr]` yields `True` if *expr* is an expression which cannot be divided into subexpressions, and yields `False` otherwise.

You can use `AtomQ` in a recursive procedure to tell when you have got the bottom of the tree corresponding to an expression. ■ `AtomQ` gives `True` for symbols, numbers, strings and other raw objects. ■ `AtomQ` gives `True` on any object whose subparts cannot be accessed using functions like `Map`. ■ See page 230. ■ See also: `NumberQ`, `Head`, `LeafCount`.
