

■ OpenTemporary

`OpenTemporary [ ]` opens a temporary file to which output can be written, and returns the name of the file.

`OpenTemporary` is often used in conjunction with `Put` and `Get` as a way of preparing data that is exchanged between *Mathematica* and external programs. ■ `OpenTemporary` always creates a new file, that does not already exist. ■ On `unix` system, `OpenTemporary` typically creates a file in the `/tmp` directory. ■ See page 298. ■ See also: `Close`, `Run`.
