

■ Or

$e_1 \mid\mid e_2 \mid\mid \dots$ is the logical or function. It evaluates its arguments in order, giving `True` immediately if any of them are `True`, and `False` if they are all `False`.

And evaluates its arguments in a non-standard way (see page ??). ■ `Or` gives symbolic results when necessary, and applies various simplification rules to them. ■ When `Or` gives a symbolic result, all its arguments are simplified. ■ See page 73.

■ See also: `Xor`, `LogicalExpand`.
