

■ PageWidth

`PageWidth` is an option for `OpenWrite` etc., `ResetMedium` and `Splice` which specifies how wide each line of printed text should be.

With `TextRendering -> Plain`, `PageWidth` gives the actual number of characters allowed on each line. ■ With `TextRendering -> PostScript`, `PageWidth` gives the number of `m` spaces (number of times the width of an `m` character) allowed. ■ `PageWidth -> Infinity` specifies that individual lines can be arbitrarily long. ■ See page 295. ■ See also: `TotalWidth`.
