

■ Plot3Matrix

`Plot3Matrix` is an option to `Graphics3D` and related functions that can be used to specify the explicit homogeneous perspective transformation matrix.

`Plot3Matrix` can be set to a 4×4 matrix which is applied to vectors $(x, y, z, 1)$ for each point. The x and y components of the results give the screen positions of the points. ■ `Plot3Matrix -> Automatic` specifies that the matrix should be computed automatically from the settings of `ViewPoint` and other options.
