

■ PlotPoints

`PlotPoints` is an option for plotting functions that specifies how many sample points to use.

The sample points are equally spaced. ■ In `Plot`, an adaptive procedure is used to choose more sample points.

■ `PlotPoints -> { $n_x$ ,  $n_y$ }` specifies different numbers of sample points in the x and y directions. ■ See pages 109 and 113. ■ See also: `PlotDivision`.
