

■ PlotRange

`PlotRange` is an option for graphics functions that specifies what points to include in a plot.

The following settings can be used for two-dimensional graphics:

<code>All</code>	all points are included
<code>Automatic</code>	outlying points must be dropped
<code>{min, max}</code>	explicit y limits; <code>Automatic</code> is used for x
<code>{{xmin, xmax}, {ymin, ymax}}</code>	explicit limits for x and y
<code>{sx, sy}</code>	specifications for each coordinate

■ For three-dimensional graphics, a setting of `{min, max}` applies to the z coordinate. ■ With the `Automatic` setting, the distribution of coordinate values is found, and any points sufficiently far out in the distribution are dropped. Such points are often produced as a result of singularities in functions being plotted. ■ See pages 109 and 112.
