

■ PolynomialQ

`PolynomialQ[expr, var]` yields `True` if *expr* is a polynomial in *var*, and yields `False` otherwise.

`PolynomialQ[expr, {var1, ...}]` tests whether *expr* is a polynomial in the *var_i*.

The *var_i* need not be symbols; `PolynomialQ[f[a] + f[a]^2, f[a]]` $\longrightarrow$ `True`. ■ See pages 230 and 383. ■ See also: `Collect`, `Series`.
