

■ Position

`Position[expr, pattern]` gives a list of the positions at which objects matching *pattern* appear in *expr*.

Example: `Position[{1+x^2, 5, x^4}, x^_]` $\longrightarrow$ `{{1, 2}, {3}}`. ■ `Position[expr, pattern]` tests all the subparts of *expr* in turn to try and find ones that match *pattern*. ■ `Position` returns a list of positions in a form suitable for use in `MapAt`. ■ See pages 177 and 235. ■ See also: `Cases`, `Count`.
