

■ PowerMod

`PowerMod[a, b, n]` gives $a^b \bmod n$.

For negative b , `PowerMod[a, b, n]` gives modular inverses.

Integer mathematical function (see Section ??). ■ For positive b , `PowerMod[a, b, n]` gives the same answers as `Mod[a^b, n]` but is much more efficient. ■ For negative b , `PowerMod[a, b, n]` gives the integer k such that $a \equiv k^b \bmod n$. If no such integer exists, `PowerMod` returns unevaluated. ■ See page 347.
