

■ Protect

`Protect`[s_1 , s_2 , ...] sets the attribute `Protected` for the symbols s_i .

`Protect`[" $form_1$ ", " $form_2$ ", ...] protects all symbols whose names textually match any of the $form_i$.

`Protect`[" $form$ "] allows metacharacters such as `*`, as specified in the notes on `StringMatchQ`. ■ `Protect`[" $context$ `\*"] protects all symbols in a particular context. ■ See pages 196 and 566. ■ See also: `Unprotect`.
