

■ PseudoInverse

`PseudoInverse[m]` finds the pseudoinverse of a rectangular numerical matrix.

`PseudoInverse[m, Tolerance -> t]` specifies that singular values smaller than t times the maximum singular value are to be removed. ■ The default setting `Tolerance -> Automatic` takes t to be 10 times the numerical precision of the input. ■ For square matrices $\mathbf{M}$, the pseudoinverse $\mathbf{M}^{(-1)}$ is equivalent to the standard inverse. ■ See page 454. ■ See also: `Inverse`, `SingularValues`, `Fit`.
