

■ Quartics

`Quartics` is an option for `Roots`, `Solve` and related functions which specifies whether explicit solutions should be generated for irreducible quartic equations.

`Quartics`→`False` causes irreducible fourth degree equations to be left unsolved in their original symbolic form. Numerical solutions can be found by applying `N`. ■ Setting `Quartics`→`True` causes explicit solutions to be generated. These solutions are usually very complicated. ■ See also: `Cubics`, `NRoots`.
