

■ Range

`Range[imax]` generates the list $\{1, 2, \dots, imax\}$.

`Range[imin, imax]` generates the list $\{imin, \dots, imax\}$. `Range[imin, imax, di]` uses step di .

Example: `Range[4]` $\longrightarrow \{1, 2, 3, 4\}$. ■ The arguments to `Range` need not be integers. ■ `Range` starts from $imin$, and successively adds increments of di until the result is greater than $imax$. ■ `Range[0, 1, .3]` $\longrightarrow \{0, 0.3, 0.6, 0.9\}$.

■ `Range[x, x+2]` $\longrightarrow \{x, 1 + x, 2 + x\}$. ■ `Range` uses the standard *Mathematica* iteration specification, as applied to a single variable. ■ See page 36. ■ See also: `Table`.
