

■ Release

`Release[expr]` causes *expr* to be evaluated, removing any “holding”.

`Release` can be used to override the “holding” of function arguments. ■ When `Release[expr]` appears as the argument of the function, that argument is immediately replaced by the evaluated form of *expr*, whether or not the attributes associated with the function specified that the argument should be held. ■ When `Release` is applied to an expression that is not a held function argument, it returns the expression with subexpressions of the form `Hold[e]` replaced by the evaluated form of *e*. ■ See page 220. ■ See also: `Hold`, `HoldAll`.
