

■ RunThrough

`RunThrough["command", expr]` executes an external command, giving the printed form of *expr* as input, and taking the output, reading it as *Mathematica* input, and returning the result.

`RunThrough` is not available on all computer systems. ■ `RunThrough` writes the `InputForm` of *expr* on the standard input for *command*, then reads its standard output, and feeds it into *Mathematica*. ■ `RunThrough` starts *command*, then gives input to *command*, then terminates the input. ■ See page 298. ■ See also: `StartProcess`, `Put`, `Get`, `Splice`.
