

■ Show

`Show[graphics, options]` displays two- and three-dimensional graphics, possibly with options changed.

`Show[g1, g2, ...]` shows several plots combined.

`Show` can be used with `Graphics`, `Graphics3D`, `SurfaceGraphics`, `ContourGraphics` and `DensityGraphics`.

■ Options explicitly specified in `Show` override those included in the graphics expression. ■ Only plots based on `Graphics` and `Graphics3D` can be combined. When plots are combined, their lists of non-default options are concatenated.

■ `Show` is effectively the analog of `Print` for graphics. The option `DisplayFunction` determines the actual output mechanism used. ■ Functions like `Plot` automatically apply `Show` to the graphics expressions they generate. ■ See pages 113 and 140. ■ See also: `Plot`, etc., and `Display`.
