

■ Sort

`Sort[list]` sorts the elements of *list* into canonical order.

Example: `Sort[{b, c, a}]` $\longrightarrow$ `{a, b, c}`. ■ Canonical order has several properties. Smaller numbers of a particular type come first. Symbols are ordered lexicographically according to their textual names. Strings are ordered lexicographically. Shorter expressions come first. ■ `Sort` can be used on expressions with any head, not necessarily `List`.

■ See page 103. ■ See also: `Order`, `OrderedQ`, `Orderless`.
