

■ String

`String` is the head of a string *"text"*.

The following codes can be used for special characters in strings:

`\"` a `"` to be included in the string
`\n` a newline (line feed)
`\t` a tab
`\mmm` a character with octal code *mmm*

- Note that the correspondence of octal codes with characters may depend on the computer system you are using.
- `x.String` can be used as a pattern that represents a string. ■ `String` is used as a tag to indicate strings in `Read`. ■ See page 278. ■ See also: `ToExpression`.
