

■ StringForm

`StringForm["controlstring",  $expr_1$ , ...]` prints the text of the *controlstring*, with the printed forms of the $expr_i$ embedded.

``i`` in the control string indicates a point at which to print $expr_i$. ■ `` `` includes the next $expr_i$ not yet printed. ■ ``\`` prints a raw ``` in the output string. ■ You can use `StringForm` to set up "formatted output". ■ The messages in the file `msg.m` are all used as control strings in `StringForm`. ■ See page 283. ■ See also: `SequenceForm`.
