

■ Subscripted

`Subscripted[f[arg1, arg2, ...]]` prints with the arg_i given as subscripts of f .

`Subscripted[expr, sub, sup]` prints with the arguments specified by *sub* as subscripts, and the arguments specified by *sup* as superscripts. Arguments not included either in *sub* or *sup* are printed in standard functional form.

The specification n takes the first n arguments. $-n$ takes the last n arguments. $\{m, n\}$ takes arguments m through n .

Example: `Subscripted[f[a,b]]` $\longrightarrow$ $f_{a,b}$. ■ `Subscripted` takes standard sequence specifications, as used by `Take` and `Drop`. ■ Example: `Subscripted[f[a,b,c], 1]` $\longrightarrow$ $f_a[b,c]$. ■ `Subscripted[expr, {}, sup]` can be used to specify superscripts only. ■ `Subscripted` does not allow subscript and superscript specifications that overlap. ■ See page 275. ■ See also: `ColumnForm`
