

■ \$ContextPath

`$ContextPath` is a global variable that gives a list of contexts to search in trying to find a symbol that has been entered.

Each context is specified by a string of the form `"name`"`. ■ The elements of `$ContextPath` are tested in order to try and find a context containing a particular symbol. ■ `$ContextPath` is modified by `Begin`, `End` and `EndAdd`. ■ `$ContextPath` is a rough analog for *Mathematica* symbols of the “search path” for files in many operating systems. ■ See pages 313, 550 and 577.
