

■ 1.8.3 Advanced Topic: Setting Options Globally

If you do not specify a particular value for an option to a function like `Plot`, *Mathematica* will automatically use a default value for the option. If you want to use the *same* value many times for a particular `Plot` option, you may find it convenient to change the default value for that option.

<code>function[arguments, ..., name->value, ...]</code>	specify options in a function
<code>Options[function]</code>	show the current list of defaults
<code>SetOptions[function, name->value, ...]</code>	reset defaults

Commands for changing default values of options.
