

■ 2.1.6 Advanced Topic: Shorter Forms for Function Application

$f @ \text{expr}$	$f[\text{expr}]$
$f @@ \text{expr}$	$\text{Apply}[f, \text{expr}]$
$f /@ \text{expr}$	$\text{Map}[f, \text{expr}]$
$f //@ \text{expr}$	$\text{MapAll}[f, \text{expr}]$

Shorter forms for function application.

This uses the whole object $\{x, y\}$ as an argument to f , as discussed in Section 2.1.3.

```
In[1]:= f @ {x, y}
Out[1]= f[{x, y}]
```

This *applies* f to $\{x, y\}$, giving a result in which f has two arguments.

```
In[2]:= f @@ {x, y}
Out[2]= f[x, y]
```

This *maps* f over the elements of the list $\{x, y\}$.

```
In[3]:= f /@ {x, y}
Out[3]= {f[x], f[y]}
```
