

■ B.7.8 Setting Up Graphics

Mathematica generates all its graphics in POSTSCRIPT.

The basic scheme is to send graphics output from *Mathematica* to a POSTSCRIPT interpreter, usually through a pipe.

<code>\$DisplayFunction</code>	default function to apply to generate graphics output
<code>\$Display</code>	default media to which to send graphics output
<code>Display[media, graphics]</code>	output <i>graphics</i> in POSTSCRIPT form to <i>media</i>

Basic graphics output objects.

<code>Identity</code>	no graphics output
<code>Function[Display[\$Display, #]]</code>	graphics output to the media <code>\$Display</code>
<code>Function[Display["file", #]]</code>	graphics output to a particular file
<code>Function[Display["!command", #]]</code>	graphics output through a pipe to an external command
<code>Function[Run["begin"]; Display["!command", #]; Run["end"]]</code>	graphics output through a pipe, running external initialization and termination programs

Typical settings for `$DisplayFunction`.
