

■ Dashing

`Dashing[{ $d_1$ ,  $d_2$ , ...}]` is a two-dimensional graphics primitive which specifies that lines which follow are to be drawn dashed, with successive segments of lengths $d_1, d_2, \dots$ (repeated cyclically). The d_i is given as a fraction of the total width of the graph.

See page 142. ■ See also: `Thickness`, `GrayLevel`, `RGBColor`.
