

■ Dimensions

`Dimensions[expr]` gives a list of the dimensions of *expr*.

`Dimensions[expr, n]` gives a list of the dimensions of *expr* down to level *n*.

expr must be a *full array*, with all the pieces of *expr* at a particular level having the same length. (The elements of *expr* can then be thought of as filling up a hyper-rectangular region.) ■ Each successive level in *expr* sampled by `Dimensions` must have the same head. ■ Example: `Dimensions[{{a,b,c},{d,e,f}}] → {2, 3}`. ■ See page 440. ■ See also: `TensorRank`, `VectorQ`, `MatrixQ`.
