

■ Apart

`Apart[expr]` rewrites a rational expression as a sum of terms with minimal denominators.

`Apart[expr, var]` treats all variables other than *var* as constants.

Example: `Apart[(x^2+1)/(x-1)]` $\longrightarrow 1 + x + \frac{2}{-1 + x}$. ■ `Apart` gives the partial fraction decomposition of a rational expression. ■ See page 386. ■ See also: `Together`, `Cancel`, `PolynomialQuotient`.
